

What's in the Sea?

The sea washes whelk shells onto the beach each day. The whelk is a shellfish, like a snail. The whelk's shell has whorls. Whorls are like curls. The whorls are all over the whelk's shell.

White whales live in the deep cold sea. When white whales are born, they are dark brown. White whales do not turn white until they are grown up. White whales talk to each other with songs of clicks and moos.

The great white shark has a white belly, but its back is gray. Great white sharks have more teeth than any other shark. They can eat seals and small whales. Sometimes, they eat their food in one bite!

This is a whale shark. The whale shark is **not** a whale. It is the largest shark and the largest fish. The whale shark can grow to be bigger than a school bus!
